

## 6.Image zoom

In OpenCV, the function that implements image scaling is: `cv2.resize(InputArray src, OutputArray dst, Size, fx, fy, interpolation)`

Code path : `/home/yahboom/Dofbot/4.opencv/02_OpenCV Transform/01 pixel operation.ipynb`

**Parameter explanation:**

InputArray src	Enter image
OutputArray dst	Output Image
Size	Output image size
fx, fy	Scaling coefficients along the x-axis, y-axis
interpolation	Insertion method

Interpolation method used by options:

INTER_NEAREST	Nearest neighbor interpolation
INTER_LINEAR	Bilinear interpolation (default)
INTER_AREA	Resampling using pixel area relationships
INTER_CUBIC	Bicubic interpolation of 4x4 pixel neighborhoods
INTER_LANCZOS4	Lanczos interpolation of 8x8 pixel neighborhoods

Notice:

- 1.Output size format is (width, height)
2. The default interpolation method is: bilinear interpolation

The main code is as follows:

```
# 1 load 2 info 3 resize 4 check
import cv2
import matplotlib.pyplot as plt # Python's 2D drawing library

# Read original image
img = cv2.imread('yahboom.jpg')
# Print out image size
print(img.shape)
# Assign the height and width of the image to x and y respectively
x, y = img.shape[0:2]

# Scale to one-half of the original size and the output size format is (width, height)
img_test1 = cv2.resize(img, (int(y / 2), int(x / 2)))
```

```

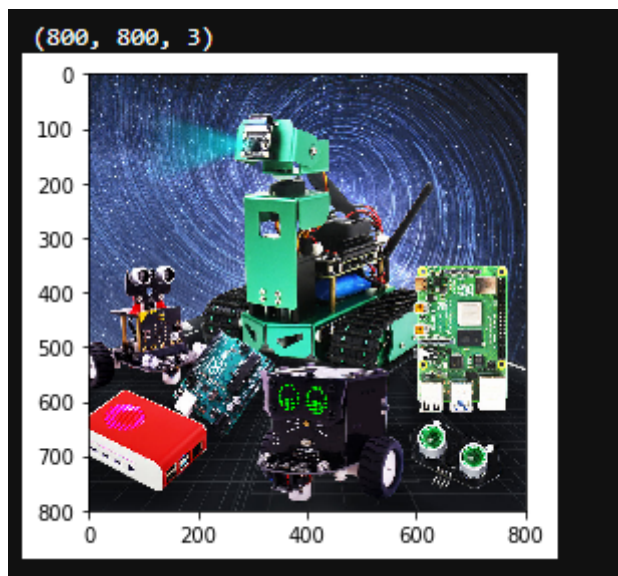

# cv2.imshow('resize0', img_test1)
# cv2.waitKey()

# Nearest neighbor interpolation scaling

# Zoom to a quarter of original size
img_test2 = cv2.resize(img, (0, 0), fx=0.25, fy=0.25,
interpolation=cv2.INTER_NEAREST)
# cv.imshow('resize1', img_test2)
# cv.waitKey()
# cv.destroyAllWindows()
img = cv2.cvtColor(img, cv2.COLOR_BGR2RGB)
dst1 = cv2.cvtColor(img_test1, cv2.COLOR_BGR2RGB)
dst2 = cv2.cvtColor(img_test2, cv2.COLOR_BGR2RGB)
# Show original image
plt.imshow(img)
plt.show()

```

After the execution is completed, you can see that the image is 800\*800

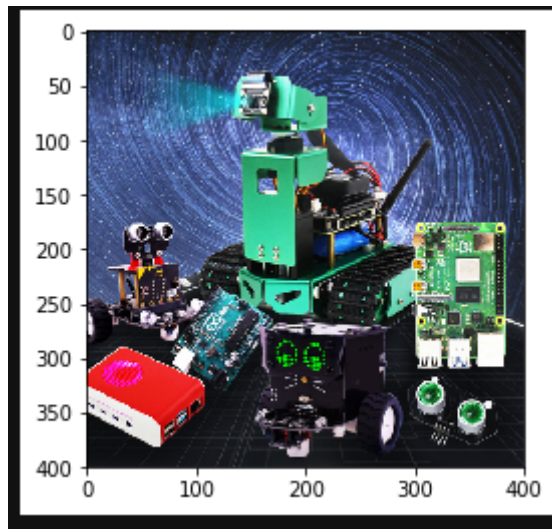

```

# Display zoom 1/2
plt.imshow(dst1)
plt.show()

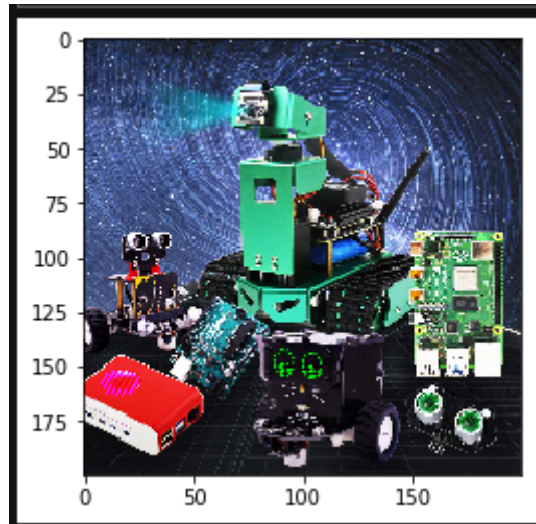

```

After the execution is completed, you can see that the image is 400\*400, scaled by half.

```
# Display zoom 1/4 Neighbor interpolation zoom
plt.imshow(dst2)
plt.show()
```

After the execution is completed, you can see that the image is 200\*200, zoomed by a quarter.

Next let's talk about matplotlib: Python's 2D drawing library.

Reference tutorial: <https://www.runoob.com/numpy/numpy-matplotlib.html>

```
import numpy as np
from matplotlib import pyplot as plt
x = np.arange(1,11)
y = 2 * x + 5
plt.title("Matplotlib demo")
plt.xlabel("x axis caption")
plt.ylabel("y axis caption")
plt.plot(x,y)
plt.show()
```
