- Learn about Dify's basic features to facilitate subsequent AI agent development

Dify

Overview

- Dify is an open-source **production-grade Agentic AI solutions** development and deployment platform. Developers can quickly build, deploy, and scale AI applications without complex technical barriers.

Features

- Visually build AI applications

Through **drag-and-drop operations**, intuitively design AI workflows and applications. Supports complex logic combinations and nesting without needing in-depth backend development. Quickly complete the construction from idea to underlying logic, and rapidly build powerful AI agent applications.

- Seamlessly connect to global model service providers' AI large models

Simply apply for the API-KEY from the corresponding model service provider to connect to hundreds of online model services with one click.

- Multi-source data support

Dify can extract and transform data from diverse sources, automatically build indexes and store them in vector databases. This provides efficient RAG (Retrieval Augmented Generation) for large models. You can directly deploy a local RAG knowledge base.

- Rich plugin system

Through Dify's rich plugins, AI large models can be combined with tools and RAG knowledge bases to become AI agents, providing assistance for AI applications in different vertical domains.
